KINAXIS MAESTRO TEMPLATE

We will find it!

WELCOME

I'm **Barry Webb**, Founder and Owner of **Eagle Eye Advisory LLC**

- Lifelong Supply Chain Practitioner – Fortune 500 Businesses, Consulting experience in Tier One firms, integrators, and Boutiques
- Industrial Engineering Background - Data Driven Analysis and Design methodology – Data mining, Cleansing, and Forensics
- Passionate about operational efficiency and business modeling for supply chain operations and business functions
- Development of client tailored business models which address the more challenging aspects of sizing and designing a warehouse, distribution center, or manufacturing operation
- Business models from Executive level through Engineering, with a systems integration support suite, **FP&A** Constructs and shared data
- **EEA - Financial Planning and Analysis (FP&A) Toolkit™** - Fact based, financial approach and “simple” models which can be used to determine critical design inputs such as inventory holding requirements, building throughput capacity, labor and operating expenses, and capital equipment – See Library for full listing

Criticality of data quality

Data integrity isn't just "important" for a Kinaxis Maestro deployment — **it is the single biggest determinant of success or failure.**

Companies that struggle with Maestro almost always trace the root cause back to dirty, incomplete, inconsistent, or poorly-governed data flowing in from ERP, WMS, TMS, MES, supplier feeds, or forecasting systems.

Maestro is an AI-driven orchestration engine!
If the inputs are wrong, the AI amplifies the wrongness.

Criticality of data quality

Maestro's core engines depend on clean, consistent data.

Maestro's most powerful capabilities – concurrency, AI runtime, semantic intelligence, and scenario modeling – all rely on accurate, harmonized data.

If data is clean:

- Plans update instantly and correctly
- AI agents detect real exceptions
- Inventory optimization works
- Demand/supply balancing is accurate
- Scenarios reflect reality
- Execution signals close the loop

If data is dirty:

- Plans oscillate or contradict each other
- AI agents chase false exceptions
- Inventory appears "available" when it isn't
- Forecasts misalign with actual demand
- Production schedules become infeasible
- Execution feedback loops break

Maestro is extremely powerful – but it is **not forgiving**.

Criticality of data quality

The most fragile data elements (the ones that break everything)

These are the fields that cause the most failures in Maestro deployments:

- Click icon to add picture

Master Data

- Incorrect item masters
- Wrong BOM quantities
- Missing or outdated routings
- Wrong lead times
- Incorrect calendars.

Inventory Data

- Inaccurate on-hand balances
- Missing in-transit updates
- Incorrect safety stock levels

Demand Data

- Bad historical demand
- Forecasts with inconsistent granularity
- Customer orders missing priorities

Supply & Production Data

- Wrong supplier lead times
- Incorrect open PO dates
- Capacity data not matching reality

Logistics Data

- Wrong transit times
- Missing shipment status updates

These fields directly drive Maestro's optimization and AI reasoning. If they're wrong, Maestro's decisions will be wrong.

Why data integrity matters more in Maestro than in older Planning tools

Traditional planning systems (SAP APO, Oracle ASCP, spreadsheets) are batch-based and **planners manually correct errors**.

Maestro is real-time, concurrent, and AI-driven

That means:

- Errors propagate instantly
- AI agents act on bad signals
- Scenarios become misleading
- Automated workflows trigger wrong actions
- Maestro magnifies both good data and bad data.

The “Data Readiness Threshold” - The minimum needed for success

Companies that succeed with Maestro typically meet these conditions:

- 95%+ accuracy in master data
 - Item masters, BOMs, routings, calendars.
- 98%+ accuracy in inventory
 - On-hand, in-transit, safety stock.
- 90%+ accuracy in lead times
 - Supplier, production, logistics.
- Forecasts aligned to the same time buckets
 - Weekly or monthly – not mixed.
- Execution systems send timely updates
 - ERP, WMS, TMS, MES.

If you meet these thresholds, Maestro performs exceptionally well.

How critical is data integrity?

Here's my personal opinion:

Maestro will not deliver value without strong data integrity.

It will deliver extraordinary value with it.

It is the difference between:

- A world-class AI-driven supply chain
- A very expensive disappointment

Enabling the solution

To enable a Kinaxis Maestro solution, the supply chain must provide a clean, connected, and semantically rich set of data elements across planning, execution, and external signals.

Maestro's AI, concurrency engine, and orchestration layers only perform at full strength when the right data is flowing into the platform.

We maintain a structured, practical list of the most critical data elements, organized by functional domain. This reflects what companies must supply during implementation and what Maestro relies on for real-time decisioning.

Getting the right data identified, mined, cleansed, connected, and ready for input is critical to the success of any Kinaxis implementation.

This is where **Eagle Eye Advisory / Skopos** can help....
